

STRUCTURE OF THE WORLD VITIVINICULTURAL INDUSTRY IN 2007

INTRODUCTION

The data published in this report have been harmonised with those available to the "Statistics Division" of the United Nations Food and Agriculture Organisation (FAO) in accordance with the cooperation agreement on the vitivinicultural industry signed by both inter-governmental organisations.

The statistical data from the FAO were normally revised in 2007. This revision most often required slight changes to the data of previous years, and these changes are integrated into the present document.

As a reminder, on a long-term basis, although production and trade monitoring still categorises the industry's main products as it has in the past (e.g. grapes, raisins, and wines), consumption statistics and statistics published by the FAO since 2006 are expressed in "primary product" equivalents, i.e. for our industry, in their equivalent in grapes.

Therefore, although it is possible for OIV member states that fill out the annual statistics questionnaire (or other questionnaires on the industry climate) to directly access information on consumption by product, non-members have been encouraged to systematically use a balance sheet-based approach to assess this information. This work, which was carried out by the OIV, has been facilitated by the quality and length of cooperation between the two organisations, which made it possible to take into account "working" data available at the FAO but not officially published.

Therefore, there are a few discrepancies between the statistics previously published by the OIV and those of the current document. As a result, although our comment mainly focuses on the world vitivinicultural situation in 2007, it also aims to put it into perspective in relation to recent years.

Finally, it should be pointed out that, as has already been the case for several years, the European Commission also contributes additional information for the purposes of the current document, especially regarding the monitoring of industrial uses and stocks in Member States.

Abbreviations used:

- mha: thousands of hectares
- Mha: millions of hectares
- mqx: thousands of quintals (100 kg)
- Mqx: millions of quintals (100 kg)
- mhl: thousands of hectolitres
- Mhl: millions of hectolitres
- l/hbt: litres per in habitant
- kg/hbt: kilograms per inhabitant

1. AREA UNDER VINES/VINEYARD ACREAGE (See appendices A and B)

This is the total land area planted with vines, whether or not the land in question currently produces grapes.

After the period of sustained growth which continued until the late 1970s, global vineyard acreage started to decline as a result of EU vine pull schemes and extensive vine pulls in the former Soviet Union.

This decrease continued at a slower pace until 1998, by which date global vineyard acreage had reached its lowest level since 1950: 7.6 Mha. A period of replanting (particularly rapid until the year 2000, with year-on-year growth above 1.4%) followed from 1998-2002, reaching 7.9 Mha.

The performances reported in 2007 tend to highlight that world vineyard acreage once again started to recede after this period of correction.

The following are the causes of these post-2003 changes:

- The ratio of plantings to vine pulls is still positive overall in countries of the Southern hemisphere and the United States (USA): (about +50 mha between 2003 and 2007, compared to +170 mha between 1998 and 2002).
- Despite the limited scope of the EU regulations governing abandonment premiums (starting with the 1996/97 campaign), as well as renewed planting rights starting in 1999, area under vines once again started to recede in Europe (including the PECO countries and the former Soviet Union). This became especially noticeable at the turn of the millennium, and led to a decrease of some 170 mha between 2003 and 2007.
- The expansion of Chinese area under vines slowed markedly from approximately +227 mha between 1998 and 2002 to some +18 mha between 2003 and 2007. This did not offset the recent decrease in Turkish area under vines, which dropped by -49 mha between 2003 and 2007, as compared to a drop of -12 mha between 1998 and 2002. Therefore despite the recent recovery of vineyard acreage believed to have occurred in Iran, Asian vineyards receded by almost 20 mha during this recent period.

Thus, in 2007, world vineyards reached a total surface area of 7,792 mha, a level midway between that of 1999 (7,726 mha) and of 2000 (7,854 mha). Compared to 2006, this decrease is rather noticeable as an absolute value (-26 mha) but slight as a relative value: -0.3%. Compared to 2003, the cumulative decrease in 124 mha, for an average annual decrease of some 31 mha (compared to average annual growth of 66 mha recorded for the period of 1998-2002).

Table 1: Area under vines (in hectares)

Periods/years	Land area
1971-1975	9 961 000
1976-1980	10 213 000
1981-1985	9 823 000
1986-1990	8 813 000
1991-1995	8 091 000
1996-2000	7 705 000
2001-2005	7 878 000
2002	7 902 000
2003	7 916 000
2004	7 859 000
2005	7 823 000
2006	7 818 000
2007	7 792 000

These various paces of change in world vineyard acreage reflect the highly diverse situations between continents and countries:

- **Africa** continued its expansion of area under vines, first seen in 1997, and reaching 394 mha under vines in 2007 (+3 mha from 2006). There was a slight reduction in South African vineyards which was more than offset by the growth of Tunisian vineyard acreage.
- North and South **America** went up slightly over the relatively high level reached in 2006 (977 mha), with 982 mha under vines. This was after the continents' area under vines oscillated between 955 and 966 mha between 2001 and 2005. USA area under vines levelled off at slightly below 400 mha, while Argentina and Brazil (with +3 mha each) maintained growth, as did Chile to a lesser degree (+1 mha in 2006).
- **Asia**, with 1.649 mha under vines, dropped 7 mha over 2006, thus confirming that it is no longer the main driver of world vineyard expansion as it had been at the turn of the millennium. A large portion of its production is still destined for non-wine use, especially in Iran, Turkey and Syria. With a new expansion estimated at 21 mha more than 2006, reaching 471 mha in 2007, China's vineyards remain the source of growth in this continent. Although the country's grape production is still dominated by table grapes, it appears to be wine grape production (or wine-and-table grape production) which accounts for most growth.

The latest available data tends to reveal that China is not the only source of growth in the continent, however, since Iran's area under vines (mainly destined for unfermented grape products) grew by 15 mha between 2003 and 2005, reaching 330 mha, a level which remained stable in 2006 and 2007.

However, both countries' expansion is offset by the downward trend in Turkish vineyards. After losing 18 mha between 2003 and 2006, the country's area under vines plummeted in 2007, losing 31 mha over the previous year.

- **Europe** has seen its area under vines steadily decline since the year 2000. However in 2007, the continent's overall decrease of 35 mha (-0.8% over 2006) was less than its average decrease reported since 2000 (-51 mha per year between 2000 and 2006).

When compared to the 2000-2006 period, the decrease in area under vines continued on average in 2007 in the EU-15 and the PECO countries. In the EU-15, area under vines dropped -18 mha between 2006 and 2007 against -26 mha between 2000 and 2006. It should be noted that most of this decrease took place in France, which was the only European Union country to undertake another extensive subsidised vine grubbing scheme. In the PECO, vineyards receded by -24 mha between 2006 and 2007 as opposed to -17 mha between 2000 and 2006. On the other hand, area under vines in the former Soviet Union posted an increase of 7 mha between 2006 and 2007. Although modest, this increase marks the end of the longstanding downward trend first started at the end of the 1980s. (To illustrate, the average annual drop in all countries of the former Soviet Union for the 2000-2006 period was -8 mha).

- **Oceania** continued to expand its area under vines, with 2007 totals standing at 204 mha (+8 mha over 2006). However, the pace of expansion was slower than that of 1995 and 2002. It should be noted that, following a period of substantial increase in Australia, this pace of expansion was particularly noticeable in relative terms in New Zealand. In 2002, the increase in vineyard acreage was almost identical for both countries in absolute terms (+13 mha and +15 mha respectively).

Of course, continental trends should be kept in perspective by weighing the relative size of area under vines on each continent. For example, Europe, the EU-15 and the EU-25 still respectively accounted for 58.6%, 43.7% and 45.5% of global vineyard acreage in 2007, compared to an average of 60.0%, 44.1% and 46.2% at the turn of the century, and 69.3%, 47.3% and 49.3% at the end of the 1980s.

Overall, the available age composition data for 2007 concerns 70% of the world's vineyards (the same percentage as 2005).

According to these data, the percentage of total world vineyards not yet producing grapes is 4.7%. This cancels out the slight rebound recorded in 2005-2006, when this percentage rose to 5.4% in 2006 (against 5.1% in 2005, 5.0% in 2004, 5.2% in 2003, 5.4% in 2002, and 6% in 2001 but on a smaller geographical area at that time).

As in the past, it should be pointed out that this average does not take into account large vineyards such as those found in China or Iran, and that it camouflages highly varied situations in 2007 (as it did with the previous years, as well).

For all countries reporting, this percentage varies from 41% in Azerbaijan (as opposed to 25% in 2006, although for a small area under vines) to 0.9% in Argentina (as opposed to 2.6% in 2006, which amounts to a virtual halt of new plantings between 2006 and 2007). It may also be noted that this figure, which had dropped sharply in the United States between 2002 and 2004 (going from 9.4% to 4.1%), and then recovered somewhat in 2005 by exceeding 5%, is once again receding and stood at 4.5% in 2007. This brings it to a similar level as that of the three largest European producers.

If we exclude Argentina (see above) and New Zealand (which maintained a high percentage in 2007 of 15.3%), a discrepancy remains, as in the past, between the percentages observed in the three largest European wine-producing countries (4.1% to 4.4%) and those of South Africa, Chile, and Australia, where they stood at between 5.6% and 6.8%. However, it may also be noted that discrepancies are narrowing. In 2005 they were 4.5% to 4.8% and 7.3% to 8.1% respectively.

Besides Argentina and New Zealand, it would appear that during recent years the percentage of vines that are not yet producing grapes is generally converging between countries, albeit at a pace that is unique to each country. This is true of the major winegrowing countries, against a general backdrop of receding areas under vines, though it should be remembered that several major Asian vineyards are not included in this report.

2. GRAPE PRODUCTION AND USE (See appendices C and Dx E)

2.1. Global grape production

After sharply increasing until the beginning of the 1980s, grape production gradually fell in step with shrinking areas under vines until the early 1990s. After this, production started to increase once again despite the fact that global area under vines continued to decrease until 1998. This situation can be partly explained by an upwards trend in yields; by more favourable average climate conditions; and by partial geographical redistribution of vineyards during this period (a higher percentage of these vineyards were located geographical zones with comparatively higher yields).

Thus, in spite of the negative influence of "El Niño" in 1998, especially in Argentina, production levels after vineyards were replanted were high in 1999 and 2000: 602 Mqx and 647 Mqx of grapes produced respectively.

This marked growth stopped during 2001, 2002 and 2003 because of unfavourable global climate conditions, with 610 Mqx, 613 Mqx and 623 Mqx respectively. This was nevertheless still a high average production level, even prior to 2004's particular large production of 677 Mqx followed by three similarly high and nearly equivalent levels of production in 2005, 2006 and 2007, nearing 666 Mqx.

Table 2: World Grape Production (in quintals - qx)

Periods/years	Production
1971-1975	554 369 000
1976-1980	605 602 000
1981-1985	628 084 000
1986-1990	606 279 000
1991-1995	552 472 000
1996-2000	600 245 000
2001-2005	638 316 000
2002	613 460 000
2003	623 880 000
2004	677 509 000
2005	666 477 000
2006	667 514 000
2007	665 219 000

Between 2006 and 2007, global changes were minimal (665.2 Mqx, a 0.3% drop over 2006, -2.3 Mqx in absolute terms). This production performance, which may rightly be considered large, was as usual the result of highly varied changes in continents and countries:

- **Africa**, with some 40.5 Mqx posted slightly decreased production over 2006 (-1.1 Mqx, or -3%). The cause is mainly lower production in Northern Africa. On the other hand, production continued to increase in South Africa and Egypt.
- North and South **America** saw their 2007 production significantly increase over 2006 (and even nearing 2005's record levels) at 141.6 Mqx against 142.3 Mqx in 2005, and 130.4 Mqx in 2006, for an 11.2 Mqx increase over 2006 (+9%). The growth on these continents was attributed to an increase in production in the United States (63.8 Mqx in 2007, production 6.3 Mqx above that of 2006) as well as major production increases in Brazil (reaching 13.55 Mqx, 1.3 Mqx more than 2006) and Argentina which produced 2 Mqx more than in 2006, itself a strong year.
- **Asia** posted new growth in 2007, with 5.9 Mqx (+3.6%) more than 2006, reaching 171.2 Mqx. This was correlated with the gradual entry into production of recently planted vineyards, especially in China. In comparison to 2006, China reported an increase of 4.3 Mqx; Turkey an increase of 1.7 Mqx, and India an increase of 0.4 Mqx, reaching 67.0 Mqx, 36.1 Mqx and 16.9 Mqx respectively in 2007.
- **Europe** saw its 2007 continental production drop to 294.5 Mqx, barely above the low 2002 levels. This was also a decrease in relation the previous year (13.6 Mqx less than 2006's 308.5 Mqx). The performances of the various production zones in Europe are contrasting.

This performance is the result of dropping production levels in the EU15, which reached 229.9 Mqx in 2007, more than 20 Mqx less than the five-year average for 2001-2005 and 21.1 Mqx less than 2006 levels. This drop is particularly noticeable in Italy, which lost 9.4 Mqx compared to 2006, and in France, where production dropped by 7.6 Mqx.

On the other hand, 2007 production was higher than that of 2006 in the countries of the former Soviet Union (30.5 Mqx against 26.1 Mqx) as well as PECO countries (32.8 Mqx in 2007, amounting to a 9.1% of 2.7 Mqx over 2006). This increase was particularly clear in Romania, where production increased by 1.7 Mqx to 11.2 Mqx in 2007, an increase of 18.1% over 2006. Throughout this region, only the Former Yugoslav Republic of Macedonia stagnated in 2007.

Production in the EU25 was 238.5 Mqx in 2007 (-20.4 Mqx over 2006 and -22.5 Mqx compared to the 2001-2005 five-year average).

- In **Oceania**, at 17.4 Mqx, 2007 production was sharply lower than 2006 (21.7 Mqx) due to a severe draught in Australia, where production fell by 4.5 Mqx to 15.3 Mqx, a 23% drop over 2006. Production in New Zealand, on the other hand, surpassed 2 Mqx for the first time in 2007.

2.2. Global fresh grape use

2.2.1. *Table grapes (see Annex L)*

Using a balance sheet-based approach, this production corresponds to the percentage of total unprocessed grape production intended for table consumption, after corrections for international trade and excluding losses (for which little data is available. All losses included, this production reached 200.0 Mqx in 2007, against 193.2 Mqx in 2006. This is an increase of 4.0%.

With 112.7 Mqx in 2007, Asia is by far the continent with the highest production. It accounts for 56.1% of world production, beating out Europe which accounts for 18.8%. Behind these two, North and South America and Africa account for 13.5% and 11.3% of global production, respectively.

This level of global production is part of a considerable upwards trend, since world table grape production grew by 26% between the end of the 1990s and the beginning of the Noughts. 2007 production was up by 48.2% over the average production of 1996-2000.

In order of size, the main world grape producing countries which all exceeded 13 Mqx in 2007 were: China (with 46.3 Mqx in 2007, or 23.0% of global production), Iran (9.0%), Turkey (7.8%), India (7.4%), Egypt (7.1%) and Italy (6.5%).

2.2.2. *Raisin production (see Appendix Q)*

This figure corresponds to the total production of grapes which are turned into raisins, regardless of the initial type of vineyard which produced them.

It should be remembered that some countries produce raisins using grapes that were initially intended for table consumption. In this way, production types are balanced out to meet market conditions.

Global production reached 12.3 Mqx of raisins in 2007 (-3.7% over 2006). This production figure may rightly be considered high since it nears the record raisin production of 2000: 12.8 Mqx.

Asia is still the leading continent for raisin production in 2007, as it was in 2006, with 6.4 Mqx produced, beating out North and South America (4.1 Mqx) and Europe (1.25 Mqx). Turkey is still the world's top producer, producing more raisins than the USA (3.4 Mqx compared to 3.15 Mqx). The next highest producers are Iran (2.25 Mqx), Greece (712 mqx) and Chile (670 mqx), followed by South Africa, Uzbekistan, Afghanistan and Argentina.

2.2.3. Pressed grapes

The quantity of pressed grapes can be estimated as the remainder of total grape production, since it corresponds to the quantity of grapes intended for purposes other than table grapes and raisins.

To do so, we use a standard coefficient of 0.25 representing raisin production from fresh grapes: i.e. it takes 4 kg of fresh grapes to obtain 1 kg of raisins.

Calculated this way, in 2007, the total quantity of pressed grapes was approximately (see *footnotes*)¹: $665.2 - 200.9 - (4 \times 12.29) = 415.2$ Mqx (against $667.5 - 193.2 - (4 \times 12.76) = 423.3$ Mqx in 2006, 431.3 and 454.1 Mqx in 2005 and 2004), thus accounting for 62.4% of world grape production. This proportion showed a continuing slightly downward trend compared with previous grape production (respectively 63.4%, 64.7% and 67.0% in 2006, 2005 and 2004) and lower than the five-year average for 2001-2005 (65.8%). There is therefore a downward trend in the overall proportion of pressed grapes, which averaged 70% between 1996 and 2000.

The upwards trend in world grape production therefore mainly benefited from the production of grapes not turned into wine, foremost of which are table grapes. Nevertheless, uncertainties regarding losses (which overwhelmingly concern fresh grapes) and domestic winemaking activities (for example, making beverage alcohol) should also be borne in mind. They often are not taken into account in official figures, yet experts believe that in some countries, these figures are substantial.

The 415 Mqx of grapes pressed in 2007 were mainly used to directly produce wines and grape juice, but also to produce intermediate non-fermented products not intended for direct human consumption, such as concentrated and non-concentrated musts and concentrated juices. This intermediate production is mainly intended for:

- reincorporation in the grape harvest in order to enrich it,
- storage, for example to extend the length of time for grape juice or wine production, or to potentially enrich a future grape harvest,
- industrial use (e.g. jam) or use in animal food.

¹ Total world production of grapes in 2007: 665,21 Mqx.

World production of grapes destined for fresh consumption in 2007: 200,92 Mqx.

World production of raisins expressed in quintals of grapes in 2007: four times the weight of dried fruit, which equals to 4×12.293 Mqx.

The currently available statistical data on the quantity of intermediate non-fermented products produced, and their intended use, do not allow for further analysis of these flows.

3. PRODUCTION FROM PRESSED GRAPES

3.1. Wine production (see Appendix F)

The 1986-1990 period was characterised by a sharp drop in world wine production compared to that of the early 1980s, since average annual production fell from 333.6 Mhl to 304.2 Mhl, i.e.-9%. At 263.1 Mhl during the following five-year period, this trend continued and even accelerated, since the drop reached 14%. Since 1995, the trend has reversed: despite occasionally unfavourable climate conditions, such as El Niño in 1998, world wine production has never dropped under the level recorded that year, due to the influence of the increase in areas under vines in particular.

Table 3: World Wine Production (other than juice and musts - in hl)

Periods/years	Production
1971-1975	313 115 000
1976-1980	326 046 000
1981-1985	333 552 000
1986-1990	304 192 000
1991-1995	263 092 000
1996-2000	272 557 000
2001-2005	272 780 000
2002	257 123 000
2003	264 266 000
2004	296 734 000
2005	280 106 000
2006	283 149 000
2007	265 994 000

World wine production in 2007 stood at 265.9 Mhl (-17.2 Mhl, or -6.1% over 2006). It can therefore be described as medium low, since it is lower than the average of the past five-year period.

- In 2007, **Africa** posted a total production of 11.2 Mhl, up slightly over 2006 (+1.4%). This growth was almost exclusively owed to South African production (+4.1% over 2006). 2007 production figures for the African continent may therefore be considered strong, since they surpass the very high production figures of 2004.

- North and South **America** posted 50 Mhl of production, an increase of 1.0 Mhl, or +2.1 over 2006. This increase is due to wine production in the United States (which, with 19.9 Mhl of wine grape production, accounts for 39.8% of the continents' production, posting a 2.2% increase over 2006) and Brazil (3.5 mhl, a 1.1 Mhl, or 47.6%, increase, despite relatively low production in 2006).
- **Asia**, with total production of 13.7 Mhl, very close to 2004 production figures, remained at a stable high level in 2007. 2007 wine production figures are almost identical to those of the previous year. In 2007, Chinese production continued to slow down.

NB: This assessment of Asian production is based on theoretical production of wine (and marginally, raisins) from that portion of Chinese grape production not intended for table consumption. The assessment is provided by the FAO. This is therefore a surplus-based approach, since total grape production is not used to produce wines according to the OIV meaning of the term, but also to produce fermented drinks from fruit juice mixes, or direct grape distillates. However, the lack of precise statistics on the type of processing these grapes undergo, as well as the recent of wine statistic compilation in China (2003) make this approach particularly suitable, since its advantage is that it does not create a statistical gap.

- **Europe** with total wine production (excepting juice and musts) of 180.1 Mhl, posted a decrease of 13.8 Mhl, a 7.1% decrease over 2006. This level is still lower than 2004's particularly strong production. Production of the European continent can therefore be considered medium low, on the whole. Trends are highly contrasting in relation to the overall decrease:

Within the EU15, the drop is 16 Mhl (-9.7% over 2006), and mainly concerns France and Italy in absolute values (with drops of 6.5 Mhl and 6.1 Mhl respectively over 2006).

During the same period, 2007 production in the PECO surpassed 2006 production by 1 Mhl, or 6.5%, reaching 16.4 Mhl of wine produced.

2007 production in the former Soviet Union was also 1.25 Mhl higher than the previous year (Russian production posted the strongest growth in 2007, at 7.28 Mhl against 6.28 Mhl in 2006).

Wine production in EU25 was 154.4 Mhl in 2007 (against 170.0 Mhl in 2006, thus dropping by 15.6 Mhl, or 9.2%). It may also be considered medium low, since average production for the revised scope stood at 165.1 Mhl between 2001 and 2005.

- **Oceania**, with 11 Mhl in 2007 against 15.6 in 2006, showed a drop compared to the previous year. This was essentially due to a considerable decrease in Australian production (-32.7% over 2006) caused by drought.

The top twenty wine-producing countries in the world are classified as follows:

Table 4: Principal wine-producing countries (in thousands of hl)

COUNTRY	2007		2006		2005		2004		2003		2002		2001-05		1996-00		1991-95	
Italy	45 981	1	52 036	2	50 566	2	49 935	2	41 807	3	42 507	2	46 936	2	54 386	2	60 768	1

We can nevertheless note that in 2007, France stopped being the world's top wine producer, a position it had occupied since 1999. Other noteworthy elements are Moldova's drop in position from 19th to 22nd; Germany's advance from 9th to 7th; and the emergence of New Zealand for the first time amongst the world's top twenty wine producers.

3.2. Production of grape juice

In several countries, there is no information on this particular type of production. Where it is available, it often encompasses both juice and must production. For this reason, given the current state of available data, it is not possible to provide any figures on this topic.

Nevertheless, based on the (also incomplete) information of table 5 concerning grape juice consumption in certain countries, world grape juice production may be reasonably estimated to be approximately 10-11 Mhl.

4. COMMERCIAL USES OF VITICULTURAL PRODUCTS

For several countries, the consumption rates presented here are apparent consumption levels, obtained from balance sheets.

4.1. Consumption of non-fermented products (See appendices O, P, T, U and V)

4.1.1. Grape juice consumption

Table 5: Grape juice consumption in a selection of countries (in hl)

COUNTRY	2007	2006	2005	2004	2003	2002
UNITED STATES	3 200	3 168	2 982	3 366	2 982	4 111
BRAZIL	1 260	1 049	996	679	693	578
GERMANY	1 028	1 055	1 190	1 190	1 012	1 087
FRANCE	638	629	625	617	614	611
JAPAN	426	426	401	366	311	302
CANADA	339	339	323	324	377	389
CHILE	275	275	367	329	412	395
UNITED KINGDOM	207	207	183	169	191	150

This table was mainly based on the OIV questionnaires received, and is incomplete. It often lacks information on grape juice consumption, such as a breakdown of the products for which data is provided (i.e. juice, juice concentrate, musts), or data on certain countries where consumption may be assumed to be considerable, such as Argentina, China, Australia, Greece or South Africa. The extent of total grape juice consumption in the USA, as well as the increase of grape juice consumption in Brazil, should nevertheless be noted.

4.1.2. Human fresh grape consumption (See Appendices O and P)

In 2007, 194.1 Mqx of fresh grapes were consumed worldwide, a 3.8% increase over 2006. This level may be considered high. +45.8% over the 1996-2000 average of 133.1 Mqx, and +16.1% over the 2001-2005 average of 167.3 Mqx.

- **Asia** is still the leading grape consumer, with 112.1 Mqx of table grapes consumed (against 108.8 Mqx in 2006, an increase of 3%). Of this, China accounts for 45.7 Mqx (including Hong Kong and Macao), Iran for 17.8 Mqx, Turkey for 17.0 Mqx and India for 14.2 Mqx. Changes in national consumption compared to 2006 were fairly consistent throughout the continent: it is growing in some countries (i.e. China, India, Lebanon, Iran, and Saudi Arabia) by between 1% and 15% over 2006, while in others (i.e. Iraq, Japan, Israel, Pakistan, Syria, Turkey and Jordan), national consumption dropped by between 1% and 34%.
- **Europe** comes next, with some 41.9 Mqx consumed, 9.7% higher than 2006 consumption levels. This level was 4.5 Mqx higher than the five-year average at the beginning of the Millennium. In quantitative terms, this year-on-year growth in table grape consumption in Europe is mainly due to the marked increase in domestic demand in Italy (where this same demand had plummeted the year before), Uzbekistan, Romania and Moldova (in the latter three countries, this trend may partly be correlated to increased total fresh grape production).
- Next is North and South **America** which, with 21.5 Mqx consumed in 2007, reached a higher level of consumption than that of 2006 (which was 20.8 Mqx). Then comes **Africa** with 18.2 Mqx, slightly down in relation to the previous year (-2.3% over 2006). Of all three continents, the largest consumers are the USA (with 9 Mqx, up 8.8% over 2006), Brazil (where consumption dropped by 7.5% over 2006) and Egypt, with 13 Mqx, where domestic consumption has continued to grow for several years.
- In **Oceania**, human fresh grape consumption was limited, and unlike 2006, in 2007 figures went under 450 Mqx.

Considered as an average per capita in 2007, human consumption of fresh grapes was highest in Albania (41.1 kg/hbt), Slovenia, (32.8 kg/hbt) and Montenegro ranked third with 26.6 kg/hbt. Macedonia, on the other hand, slipped from its previous position as third-largest consumer, following a short-term drop in consumption (15.5 kg/hbt in 2007 versus 30 kg/hbt in 2006). It should be remembered that these are apparent consumption levels, most obtained from balance sheets. Therefore, they quite likely confuse the consumption of fresh grapes proper with consumption for domestic winemaking purposes (e.g. Rakia¹).

¹ Alcool vitivinicole en Macédoine et en Bulgarie

Besides these four countries, apparent consumption stands at 13 to 25 kg/hbt in Iran, Turkmenistan, Armenia, Serbia, Greece, Turkey, Lebanon, Cyprus, Egypt, Moldova, Italy and Uzbekistan, and from 6 to 11 kg/hbt in Hungary, Azerbaijan, Bulgaria, Tunisia, Morocco, Malta, Iceland, Korea, Saudi Arabia, Afghanistan and Syria.

The Americas and Oceania are still the three continents with the lowest fresh grape consumption/hbt (of all three continents, the largest consumer is still Canada, at 5.7 kg/hbt).

4.1.3. Raisin consumption (see Appendices T and U)

In 2002, 11.9 Mqx of raisins were consumed in the world, or +1.1% over 2006. For the third year in a row, this performance is very close to, and even slightly above, the high level of raisin consumption reported in 2000 (12.6 Mqx).

- While Asia is by far the leading producing continent, it is not the leading consumer: **Europe** posted consumption of 5.1 Mqx, a slight 0.8% increase over 2006 (whereas the increase between 2005 and 2006 was 2.6%). Increased domestic consumption in the Netherlands, United Kingdom and Poland account for this overall increase. The main domestic market in Europe remains the United Kingdom, followed by Germany and Russia.
- **Asia** is therefore the third largest consumer, with 3.69 Mqx, almost the same as 2006 (3.67 Mqx). This is mainly due to a drop in Turkish consumption, which fell by 190 mqx between 2006 and 2007 (-13.5%), in comparison to high 2006 levels. These drops were offset by the increases reported in Afghanistan and, to a smaller extent, Israel, Japan and Pakistan.
- Asia is followed by North and South **America** (with levels strongly influenced by the relative weight of the USA, accounting for 71.3% of the domestic market for the continent in 2007, and by far the largest national domestic market in the world). With 3.3 Mqx consumed, its consumption increased by 2% over 2006, while staying lower than consumption levels reached on the continent between 2000 and 2002 (4.3 Mqx to 3.5 Mqx).
- Next is **Oceania** (0.43 Mqx consumed) and **Africa** (0.28 Mqx consumed). In Oceania, as with Africa, domestic markets generally stayed stable between 2006 and 2007.

Expressed as an average/hbt in 2007, human raisin consumption is highest in Greece (3 kg/hbt). It should be borne in mind that part of this apparent consumption corresponds to ouzo consumption. Next are the Netherlands (2.9 kg/hbt), United Kingdom (2 kg/hbt), New Zealand (2 kg/hbt), Australia (1.7 kg/hbt) and Turkey (1.6 kg/hbt). Other countries reporting consumption in excess of 1 kg/hbt are Iceland, Denmark, Ireland and Lithuania in Europe; Lebanon, Jordan and Iran in Asia, and Canada in North America.

4.2. Wine consumption (see Appendices I and J)

From the beginning of the 1980s to the mid-1990s, world wine consumption lagged. As was the case for production, it was during this period that the trend started to reverse, as may now be affirmed with ten years of hindsight. World consumption stopped falling and slowly started to rise.

2007 showed a new increase of 5.2 Mhl in world consumption, reaching 249.2 Mhl (+2.1% over 2006). This follows a 5.6 Mhl increase between 2005 and 2006. This change therefore confirms the above-mentioned trend.

The last known three-year trend (2005-2007) stood at 243.9 Mhl, or 5.6 Mhl more than the previous three-year average (2003-2005: 238.3 Mhl).

Tableau 6: World wine consumption (in hl)

Periods/years	Consumption	Difference over previous year
1971-1975	280 356 000	
1976-1980	285 746 000	5 390 000
1981-1985	280 718 000	-5 028 000
1986-1990	239 473 000	-41 245 000
1991-1995	223 155 000	-16 318 000
1996-2000	224 629 000	1 474 000
1998	228 119 000	
1999	225 536 000	-2 583 000
2002	229 998 000	2 523 000
2003	237 386 000	7 388 000
2004	239 040 000	1 654 000
2005	238 387 000	-654 000
2006	244 000 000	5 613 000
2007	249 190 000	5 190 000

- **Europe** is by far the continent with highest consumption, with wine consumption of 165.5 Mhl (66% of world consumption in 2007), even if its majority is slowly shrinking (73.8% at the end of the 1980s). In 2007, the continent's consumption rose for the second consecutive year by 2.6 Mhl (+1.6%) over 2006 (but +6.2 Mhl compared to 2005, which had posted low consumption levels for the whole continent).

This performance, compared to 2006, was obtained due to:

Short-term stabilisation of consumption in the EU15, reaching 128.3 Mhl: Positive changes posted in the United Kingdom (+1 Mhl) and Sweden offset the long-term decrease reported in countries traditionally associated with high wine consumption (especially noticeable in France between 2006 and 2007: -0.85 Mhl).

An overall increase of 0.75 Mhl in the PECO (notably, a sharp increase in consumption in the Czech Republic: +470 mhl, or +36.2% over 2006, as well as Slovenia with +149 mhl, or +27.7%, and Poland +154 mhl, or +21.5%).

A continued increase in consumption within the former Soviet Union (+1.6 Mhl over 2006), particularly in Ukraine, Georgia and Russia.

Wine consumption in the EU25 stood at 135.5 Mhl in 2007 (and continues the current upward trend with a 0.6 Mhl, or 0.5%, rise over 2006). This figure is mainly due to overall positive growth in new member States. It is very close to the reconstituted average consumption reported for 2001-2005 for this group of countries, which stands at 135.4 Mhl.

- North and South **America**, at 53.3 Mhl (+1.7 Mhl, or +3.4% over 2006) saw consumption levels rise once again after the increase reported between 2005 and 2006 (+0.9 Mhl). This is due to continued growth in the USA (28.25 Mhl in 2007: +4.1% over 2006), Canada (which reach 4 Mhl of wine consumed) and Chile, where the short-term high level of domestic consumption reached almost 3 Mhl in 2007.
- **Asia**, with 17.8 Mhl of wine consumed, and slightly slower growth than in previous years (+2.4% over 2006), is the third largest wine consumer. China, the continent's main growth driver in recent years, saw continued growth in domestic consumption, but at a slower pace than the previous year (+2.3% between 2006 and 2007 against +5% between 2005 and 2006). The 13.1% drop in (already modest) wine consumption in Turkey should also be noted (203 mhl in 2007 against 234 mhl in 2006).

NB: This is apparent consumption in China, as obtained from the balance sheet (estimated using FAO data) by looking at "Production + Imports - Exports". This quite likely leads to the assimilation with wines of other beverages made with grapes (including distilled beverages, since there is no accessible data on wine processing). Other non-official assessments derive this quantity from the sales of wine-producing companies, in the OIV sense of the term. However, the thoroughness of these data is unknown, and taking them into account would cause a break in the statistical series (since statistics were not compiled for wine per se in China until after 2003). These assessments bring quantities down by one half, since bulk-imported wines are generally included with wines produced from Chinese grapes in the figures of bottled-wine sales of these major companies.

- Next come **Africa** and **Oceania**, with 6.8 Mhl and 5.8 Mhl of wine consumed respectively. Both continents post similar trends: 3% growth in African demand (where South Africa saw an increase in domestic demand) and 4.4% in Oceania (both in Australia [+4%] and New Zealand in 2007 [+7%]).

With regard to the average wine consumption/hbt and per annum:

Apart from Luxembourg (whose figures are difficult to interpret given the reasonable assumption that non-resident purchases have a major impact on the apparent result), it should be noted that high levels of consumption are logically found in **countries that are traditionally leading producers and consumers of wines**, and that these countries, in general, are seeing a long-term downward trend in their individual levels of consumption.

This applies to:

- France (52.1 l/hbt in 2007: -1.7 l/hbt over 2006),

- Italy (45.0 l/hbt in 2007: -1.3 l/hbt over 2006),
- Portugal (42.5 l/hbt in 2007: -2.7 l/hbt over 2006),
- Spain (29.7 l/hbt in 2007: -1.3 l/hbt over 2006),
- Argentina (28.3 l/hbt in 2007: -0.1 l/hbt over 2006),
- Hungary (26.9 l/hbt in 2007: -1.8 l/hbt over 2006).

Some of these countries may undergo short-term upward swings in an otherwise downward trend. In 2007 this was the case of Chile (17.9 l/hbt in 2007: +3.4 l/hbt over 2006), and Romania (25.8 l/hbt in 2007: +0.1 l/hbt over 2006).

- However, the case of Greece should be noted: consumption reached 29.7 l/hbt in 2007, and despite an interruption in 2006, consumption had recovered during the three previous years. It should be remembered that, as with last year, these figures should be considered somewhat cautiously, since part of this apparent consumption (impossible to assess) likely concerns home-distilled products.

The same can be said for:

- Macedonia (5.9 l/hbt in 2007),
- and Moldova (2.8 l/hbt in 2007).

Nevertheless, in some countries traditionally known for their extensive production and consumption of wine (and other alcoholic drinks), individual consumption has levelled off or is growing at a slow pace.

This was especially the case in Germany, where individual consumption stood at 25.3 l/hbt in 2007 (+0.7 l/hbt over 2006).

In Austria (29.4 l/hbt in 2007: -0.1 l/hbt over 2006) individual consumption appears to be levelling off at around 29 l/hbt over the medium term.

In Switzerland, although consumption rose in 2007 (38.9 l/hbt in 2007 against 37.5 l/hbt in 2006), individual consumption levels appear to be slowly tapering off over the medium term.

In Slovenia, on the other hand, individual consumption rose sharply by 7.4 l/hbt to reach 34.2 l/hbt in 2007. However, over the medium term, this level is fairly unpredictable, with the last known five-year average (2003-2007) being 30.3 l/hbt/year.

However, in this group, two exceptions bear mention: Russia and Ukraine continue to post growth in individual wine consumption levels, reaching 8.2 l/hbt and 5.8 l/hbt respectively in 2007 (respectively 6.0 l/hbt and 3.7 l/hbt in 2003 and 7.5 l/hbt and 4.9 l/hbt in 2006).

- In **new wine-producing countries**, where production potential has recently been increased, changes observed are varied and generally progressing at a slow pace, but mostly downwards.

For example:

In Australia and New Zealand, individual consumption has risen at a fairly constant pace since at least the mid-1990s: from 18.0 l/hbt in 1996 to 22.9 l/hbt in 2007 in Australia, and from 1.0 l/hbt to 2.2 l/hbt in New Zealand during the same period.

In North America, it also increased, apparently more significantly since 2002, reaching 9.2 l/hbt in the USA and 12.2 l/hbt in Canada in 2007.

After near-stable levels between 1999 and 2004 (around 1.7 l/hbt) and a short-term increase to 2 l/hbt in 2005, individual consumption in Brazil settled back down to its previous level in 2007 (1.7 l/hbt).

In South Africa, where individual consumption has been falling, figures slightly inched upwards to 7.2 l/hbt.

However, in China, individual consumption struggled to pursue its growth after the sharp increases reported until 1998. It remained at 1 l/hbt in 2007 (although the multiplying factor of the country's demography should not be discounted. It should also be remembered that this apparent consumption partially includes fermented grape-based products incorrectly categorised as wine as well as, quite likely, brandies.)

- Finally, in **modest or non-wine producing countries**, there is generally a growing trend in individual consumption. For example, 2007 figures for the following countries were all greater than 2006 figures: Sweden (19.3 l/hbt in 2007), Ireland (16.8 l/hbt), Norway (13.9 l/hbt), Finland (10.6 l/hbt), and Poland (2.3 l/hbt).
- In non-producing countries where wine has been significantly present for several years, figures appear to be levelling off or at least slowing down in comparison to previous years. This was the case in Belgium (27.5 l/hbt in 2007, a slight decrease of 0.2 l/hbt over 2006); the Netherlands (21.6 l/hbt in 2007, a slight increase of 0.2 l/hbt over 2006); and Denmark, where individual consumption continued its recovery to near figures reported at the turn of the millennium. Finally, in the United Kingdom, after a fairly noticeable drop between 2005 and 2006, in 2007 a high figure was reported: 22.6 l/hbt.

4.3. Stocks and other commercial uses of wines; price trends on certain markets

4.3.1. Stocks (see appendix K)

An analysis of global wine stocks (in the vineyards and at the retailers) is difficult, firstly due to a lack of systematic, regular data, and secondly due to a lack of data on the extent of industrial uses.

However (given that for the 2006/2007 campaign, stock data is available for both the beginning and end of the financial year for a set of countries representing 71.1% of 2006 world wine production in 2006) it may be logically inferred that global wine stocks at the end of the 2006/7 campaign were lower than those at the beginning of the same campaign (-2.2%/stock at the beginning of the campaign for all countries monitored, or -4.4 Mhl for this sample). In macro-economic terms, this trend is consistent overall with, firstly, the modest increase in world wine production between 2005 and 2006 (+3 Mhl, or 1.1%) and secondly, with the fairly large, 5.6 Mhl year-on-year growth in world consumption for the same period (compared to the short-term halt in its growth reported between 2004 and 2005). However, as indicated for previous years, it should be remembered that a "mechanical" line of reasoning cannot be used to forecast year-end stocks using the monitored levels of wine production and consumption, given the existence of alternative uses of wine in industry, other

than consumption.

This trend towards a slight reduction in stocks at the end of the 2006/7 campaign is fairly general throughout countries for which data is available, with the notable exception of Brazil and Australia, where these stocks increased by some 0.9 Mhl.

4.3.2. Other commercial uses

In this area as well, data is not yet available for all countries. For example, data on distillation is only available for a set of countries accounting for 74% of world wine production in 2006.

It is worth noting, however, that on the EU15 market, approximately 21.0 Mhl (against 26.0 Mhl in 2005/06, 22.4 Mhl in 2004/05 and 24.8 Mhl, 20.3 Mhl and 22.8 Mhl respectively in 2001/2002, 2002/2003 and 2003/04) were used for the production of wine distillates and dregs in 2006/2007 (including the volumes used to make Cognac and Armagnac, the two French AOC brandies) to which should be added for the same market nearly 3.8 Mhl (against 3.4 Mhl, 5.2 Mhl, 5.5 Mhl and 3.9 Mhl respectively from 2002/03 to 2005/06) of wines for the other industrial purposes of vinegar and vermouth production.

Outside the EU15, we only have 2006/2007 data on wine distillation in Argentina, Brazil, South Africa and Australia, as well as Cyprus, Hungary, the Czech Republic and Romania, for a total of some 2.7 Mhl (including 2.5 Mhl in South Africa). Approximately 300 000 hl were used for other industrial purposes.

This takes into account approximately 27.8 Mhl of wines for industrial purposes in 2006/07 (compared to 31.2 Mhl, 28.3 Mhl, 32.5 Mhl, 31.9 Mhl and 33.0 Mhl respectively between 2001/2002 and 2005/2006, for a set of comparable monitored countries for which data was gathered). This is still an approach based by deducting this amount from the total volume of wines for industrial purposes.

The data from this 2006/2007 campaign leads us to lower the range of figures established for the previous campaign to between 30 and 35 Mhl (for 2005/6 it was 35 to potentially 40 Mhl; for 2004/5 and 2003/4 it was 33 to 38 Mhl of wine for industrial purposes, as compared to approximately 32 Mhl for the previous campaign, slightly more [around 35 Mhl] than 2001/2, but around 40 Mhl in 2000/1).

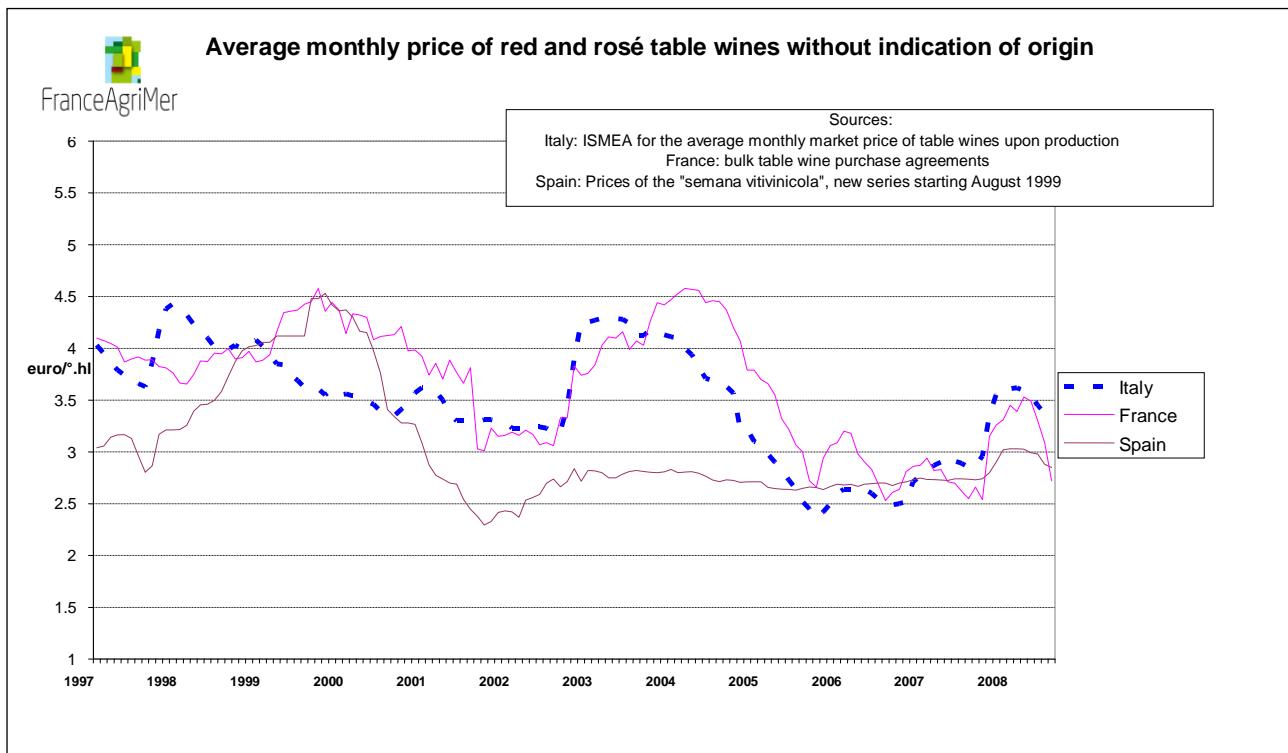

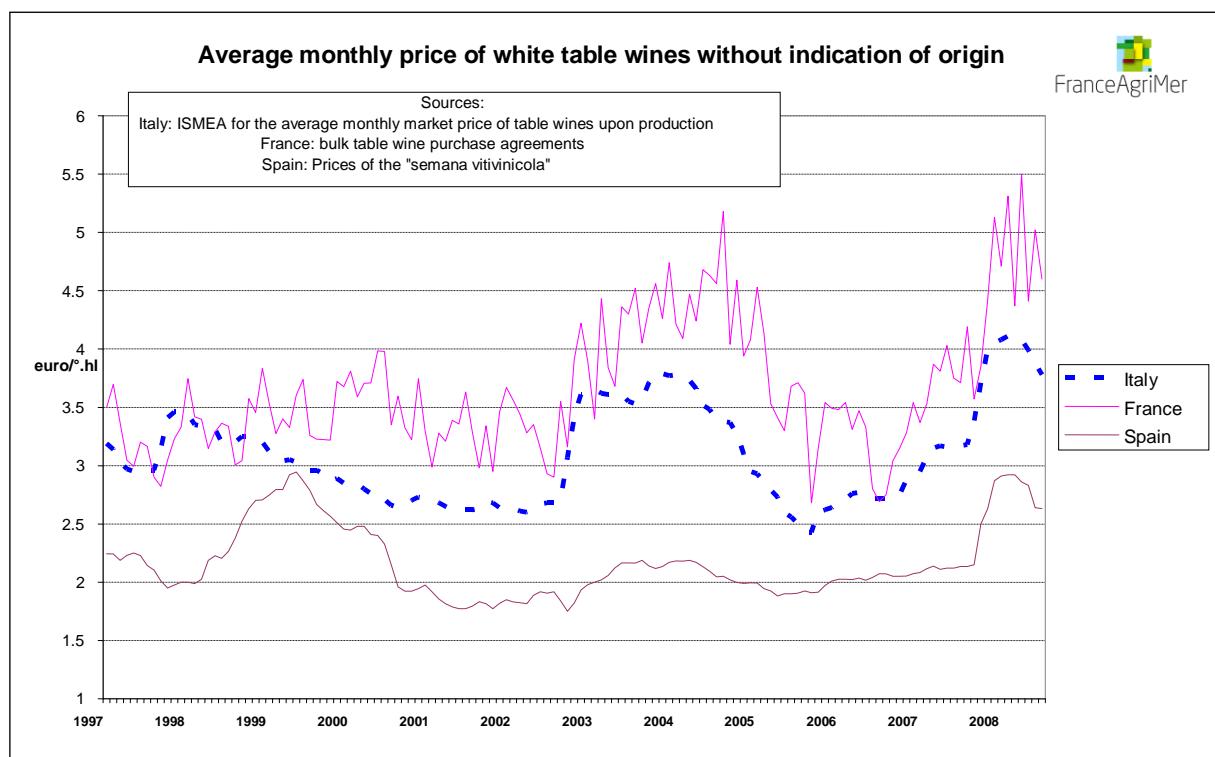

4.3.3. Price trends for certain wines on production markets

After the shock caused by the large harvest of 2004, the "average" quantity produced in the EU15 by the 2005 harvest, combined with high carryover stocks, led to high availability during the 2005/2006 campaign, and in turn, maintained overall prices at the lows reached during the 2004/2005 campaign.

Throughout the EU15, 2006 production remained at levels near those of 2005. Along with relatively lower carryover stock compared to those of the end of the 2004/2005 campaign, 2006 production lessened availabilities somewhat. However, at the beginning of the 2006/2007 campaign, this reduction in turn only led to a renewed increase for white wines, while for red and rosé table wines with no provenance on the label, prices stayed stable, possibly an indirect sign of a global demand indicator (both domestic and foreign) on this market segment which is apparently also decreasing.

Despite a significant drop in world production between 2006 and 2007 (bearing in mind that this drop principally concerns the EU15; -16 Mhl in the EU15 out of -17 Mhl worldwide), and very slight changes to carryover stocks, leading to a lower level of initial availability for the 2007/2008 campaign in comparison to the previous campaign, it may be observed that:

- For red and rosé wines with no indication of provenance, prices are recovering at a faster pace than in 2006/2007, but still temporarily and at a slower pace towards the end of the campaign (despite announcements of a medium low harvest for the 2008 production). It should also be noted that this price movement also concerns Spanish wines.
- The continued recovery trend for prices of white wines without indication of provenance was also slight at the end of the campaign. As for reds and rosés, it should also be noted that this price movement also concerns Spanish wines.
- Here again, despite announcements of a modest 2008 harvest in the EU15, the downward trend of the end of the campaign allows for the supposition that the overall demand indicator for these wines (without indication of either provenance or grape variety) is dropping.

CURVE 1**CURVE 2**

5. FOREIGN TRADE IN VITIVINICULTURAL PRODUCTS

5.1. Foreign trade in fresh grapes (see appendices M and N)

In 2007, foreign trade in fresh grapes once again registered growth in volume for imports (35.4 Mqx in 2007, up 4.1% over 2006), while exports stayed almost unchanged by volume compared to the previous year (36.3 Mqx in 2007 and 2006).

In 2007, the USA remained the leading world importer with almost 5.9 Mqx, ahead of Russia (3.8 Mqx). These were followed by Germany with 3.2 Mqx imported, the Netherlands (3 Mqx), the United Kingdom (2.5 Mqx), Canada (2 Mqx) and France (1.5 Mqx).

The USA led exports (15 Mqx). Chile remained the world's leading exporter at 7.8 Mqx exported, beating out Italy once again (4.4 Mqx of fresh grapes exported). These were followed by the USA, with 3.9 Mqx exported, which thus still seemed to be the most open market for fresh grapes (leading importer and third largest exporter in the world).

These three countries have higher exports than South Africa (2.9 Mqx), Mexico (1.8 Mqx), the Netherlands (1.7 Mqx because of its considerable port activity), Turkey (1.6 Mqx), Egypt (1.2 Mqx) and Uzbekistan (1.1 Mqx), which had the same level of exports as Spain, in front of Brazil (791 mqx in 2007).

This market, with a "World Market (i.e. in this case all exports for all countries)/World Consumption" ratio of 18.7% in 2007, compared to an average of 17.8% in both 1996/2000 and 2001/2005, is going global at a slow pace. This ratio, however, remains low in comparison with other products in the sector, and therefore indicates the extent of local table grape consumption, as well as the relative fragility of the product compared to raisins and wines.

5.2. Foreign trade in raisins (See Appendices R and S)

World foreign trade in raisins in 2007 exceeded the already high figure of 2006. Compared to 2006 levels, 2007 figures show a 6.6% increase in raisin imports (8.4 Mqx) and a 0.6% increase in exports (7.9 Mqx).

Therefore, when compared to the last five-year average for the 2001-2005 period, the changes are +16.9% and +14.1% respectively.

The United Kingdom remained the world's largest importer of raisins in 2007, at 1.2 Mqx imported, beating out Germany (818 mqx), Russia (676 mqx), the Netherlands (588 mqx), Canada (337 mqx), Japan (320 mqx), the United Arab Emirates (300 mqx), the USA (284 mqx), France (276 mqx), Australia (267 mqx) and Italy (221 mqx).

As for exports, Asia was by far the leading exporter in 2007, led by Turkey (2.2 Mqx exported in 2007) and Iran (1.5 Mqx). These countries are followed by the USA (1.2 Mqx), Chile (620 mqx), South Africa (411 mqx), Uzbekistan (306 mqx), Argentina (289 mqx), China (257 mqx) and Greece (238 mqx).

The "world market/world consumption" ratio for this market is very high. It reached 61.5% in 2007, at almost the same level as last year's record (61.8%) and far exceeds the average ratio recorded for 2001-2005 (56.4%). It is noteworthy that this ratio stood at 52.6% from 1986-1990. Therefore, the rate of internationalisation of trade for this product, which is already high, appeared to pick up again in 2007. For producing countries in Asia, raisins could almost be considered export products, since the continent still exported almost two thirds of its raisin production in 2007.

5.3. Foreign trade in wines (see Appendices G and H)

Still considering the world market as the sum of all exports for all countries, in 2007 it stood at 89.4 Mhl (+6.8% over 2006). In 2007 this world market continued to thrive since it posted a 23.8% increase over the 2001-2005 average. Overall, total imports accounted to 84.99 Mhl (+5.8% over 2006).

The world market accounted for 36.2% of world consumption in 2007, against a scant 18.2% on average from 1986-1990. It is therefore the wine market which, in relation to the other products of the sector, has seen its degree of internationalisation develop fastest since 1990.

It should be remembered that non-EU exports, reconstituted by CCE.C3 services for 2000 to 2006, logically concerned EU25 (for the NC 2204 item as a whole). Exports to non-EU25 countries totalled 16.85 Mhl in 2006, 13.61 Mhl in 2005, 12.16 in 2004, 11.58 in 2003, 11.76 in 2002 and 11.14 Mhl in 2001.

2007 figures included the two new member States, Bulgaria and Romania, and therefore concern the EU27. Exports to non-EU countries totalled 17.91 Mhl.

For the purposes of comparison and measuring changes in EU and non-EU wine trade, non-EU exports previous to 2007 have been recalculated here to constitute an "EU27": 2006: 17.21 Mhl, 2005: 14.24 Mhl, 2004: 12.67 Mhl, 2003: 11.89 Mhl, 2002: 12.07 Mhl and 2001: 11.42 Mhl).

Thus, considered on the basis of 27 member states, non-EU exports rose by 0.7 Mhl, or 4.1%, between 2006 and 2007, and by almost 5.5 Mhl (43.8%) relative to the 2001-2005 average of 12.46 Mhl.

Given that the total exports of the EU27 reached 60.78 Mhl in 2007 (+2.7 Mhl and +4.6 % relative to the equivalent 2006 figure and +9.5 Mhl and +18.5% over the 2001-2005 average), intra-community exports therefore accounted for 42.87 Mhl, or some 2 Mhl more than the equivalent figure for 2006 (+4.8%), but only 4 Mhl more relative to the equivalent figure calculated for the 2001-2005 average (+10.4%).

A few observations stand out:

- While all intra-community trade (here, its 27 member-state equivalent as measured for exports) accounted for 38.8 Mhl, or 53.7M of the world market on average from 2001-2005, even though they had intermittently risen by 4 Mhl, in 2007 they only accounted for 47.9% of the world market. This demonstrates that it is not a growth driver in world trade.
- The world market, outside of intra-community trade for the EU27, is therefore more dynamic over the medium term, reaching 89.45 Mhl –

42.87 Mhl = 46.58 Mhl in 2007, against 42.9 Mhl in 2006 (+8.5%) and 33.4 Mhl on average for 2001-2005 (+39.4%).

- Despite this changing trend, it may be noted that in the short term, the pace of growth of intra-community exports for the EU27 was higher than non-EU exports for these same countries between 2006 and 2007 (+4.9% against +4.1%).
- World exports of non-EU27 countries, all destinations combined, rose rapidly: between 2006 and 2007 by some 3 Mhl (+11.5%) reaching 28.7 Mhl, and by 36.9% relative to the 2001-2005 average.

5.3.1. Wine imports

- **Africa** reached 2.5 Mhl of wine imports in 2007, thus maintaining its 2006 level. Angola, Côte d'Ivoire, and South Africa are still the continent's leading traditional importing countries. Botswana's strong (and possibly short-term) import figures are noteworthy.
- North and South **America** also saw a continued upward trend in imports in 2007, after a hiatus between 2003 and 2004; the two continents reached 13.87 Mhl in 2007, a 7.6% increase over 2006. The USA, with 8.37 Mhl imported in 2007 (+8.5% over 2006), confirm their place as the world's third largest wine importer before Russia and France (6.4 Mhl and 5.4 Mhl of wine imported respectively). It is also noteworthy that Canadian imports are following the same trend, reaching 3.1 Mhl in 2007 (+2.5% over 2006). As for Mercosur, Brazil and Paraguay have also seen a rise in imports.
- **Asia** (after a surge in Japanese imports in 1998 and uninterrupted Chinese growth since 2002) continued to see its imports rise in 2007 to 4.76 Mhl (+13.5% over 2006). Several countries are concerned by this increase in imports, especially China which posted a new increase of 28.3% over 2006, and Korea with +43.3%.
- **Europe**, by far the leading continent for imports (74% of world imports in 2007) saw its total import volume rise by 2.86 Mhl to reach 62.9 Mhl in 2007 (+4.8% over 2006). This was notably due to increased imports in Italy (which went from 1.4 Mhl in 2006 to 1.7 Mhl in 2007), Spain (+15.5% over 2006), the Netherlands (+11.9% over 2006), Greece, Sweden, Poland, Slovakia, Ukraine and Russia.

Imports picked up in the United Kingdom, the world's second largest importer by volume, after a short pause in 2006 which followed a very long phase of near continuous growth (11.67 Mhl, or +3.5% over 2006), while imports to Germany, which remains the world's leading importer, were up 5.7% over 2006, standing at 15.5 Mhl.

It may also be noted that import levels for the Czech Republic are now confirmedly and considerably above 1 Mhl, although slightly less than 2006 levels (1.33 Mhl in 2007 against 1.38 Mhl in 2006). Another noteworthy figure is the renewal in imports in the Netherlands (3.8 Mhl in 2007, or +11.9% over 2006, of which part is apparently intended for re-export), after a 2006 interruption of the renewed increase that started in 2003.

- **Oceania**, at 1 Mhl, saw its modest level of imports grow in 2007 (+27.1% over 2006). It is the increase in Australian imports, apparently linked to the sharp decrease in its production, which is at the origin of this rise. For the first time, Australia therefore became the continent's leading importer, ahead of New Zealand.

5.3.2. Wine exports

As indicated above, the increase in exports continued between 2006 and 2007. In 2007, they rose or fell in a fairly consistent fashion depending on the continent.

- **Africa** posted a rise in exports compared to the previous year, with 3.3 Mhl against 2.9 Mhl in 2006. This was due to an increase in South African exports (3.1 Mhl, +15.1% over 2006).
- North and South **America** continued the upward trend in their exports in 2007, reaching 14.1 Mhl (+22.3% over 2006). The short-term drop of 2005 was therefore wiped out. This growth at the continental level is due to the following combination of trends: Chile, the leading exporter of the Americas (with 6.1 Mhl), saw its exports jump in 2007 (+28.7% over 2006). The change in Argentine exports was also in harmony with the country's rapid expansion since 2004; 3.6 Mhl in 2007, or +22.6% over 2006. The USA continued its growth in exports in 2007, a trend which started in 2002. Exports reached 4.2 Mhl, or +12.5% over 2006.
- **Asia**, a modest exporter, saw its 2007 export levels rise again after stagnating in 2006. China, Cyprus and Singapore brought the continent's exports up to 534 mhl, a figure that was reduced by a drop in Turkish exports (-8% over 2006).
- **European** wine exports increased overall, nearing 62.9 Mhl, or 70% of world exports in 2007 (against 84% at the end of the 1990s). This result for the continent is due foremost to growth posted by the main exporters: Although Italy's 2007 exports neared 2006 levels (18.5 Mhl in 2007 against 18.4 in 2006), those of France, the world's second largest exporter by volume, rose to 15.24 Mhl (up 0.5 Mhl, or 3.6% over 2006); with over 15 Mhl of wine exported (+0.73 Mhl, or +5.2% over 2006), Spain broke its 2005 record (14.4 Mhl) in 2007;

Germany, the fourth largest exporter in Europe and eighth largest in the world, also saw exports rise by 10.8% between 2006 and 2007, reaching 3.5 Mhl;

Portuguese exports also increased by almost 0.5 Mhl over 2006 to reach 3.4 Mhl (+17% over 2006). Therefore, the EU15 states posted an increase of 2.5 Mhl, or +4.4% over 2006.

In the PECO in 2007, the Czech Republic, Hungary and the Former Yugoslav Republic of Macedonia reported considerable increase in exports over the year, at least in relative terms. This more than offset the slight dips in exports in Romania and Slovenia.

However, the former Soviet Union saw its overall exports plunge significantly in 2007 (-0.5 mhl, or -28.9% over 2006), thus nearing its relatively low performance of 2000. The continued drop in Moldovan exports largely explains this result (-468 mhl, or -45.9% over 2006). Wine exports also dropped in Russia and Georgia.

These overall positive results for the continent, stripping out the former Soviet Union, led to a 2007 performance up by 2.1 Mhl (+3.5% over 2006).

- **Oceania** once again clearly improved its export performance, reaching 8.6 Mhl of wine exports in 2007, up 446 mhl, or +5.5%, over 2006. This increase in exports happened at a relatively fast pace between 2006 and 2007, especially in New Zealand (+31.5% over 2006), although in absolute terms, it is logically Australia which accounts for the largest share of growth in the continent (with 7.8 Mhl in 2007, +3.5 % over 2006).

6. CONCLUSIONS

6.1. Non-fermented products

Reprocessing series' of statistics over a long period, as has been done since 2001, provides a more detailed representation of the fresh grape and raisin markets. However, like last year, the market for grape juice and non-fermented intermediate products still remains vague (there has still been no substantial improvement to monitoring of musts by the various national statistics committees). However, an attempt may be made to analyse overall management data for these industries on the world level.

It should be remembered that previous analyses of the percentage of total grape production earmarked for purposes other than pressing has been slowly increasing (on average by 28% for 1986-1990, 29% for 1991-1995, 30% for 1996-2000, and 34% for the last known five-year period, 2001-2005); the percentage of production earmarked for table consumption has increased more quickly (but only since 15 years ago) than the percentage intended for raisin production (75% on average for 1986-1990, 73% on average for 1991-1995, 75% on average for 1996-2000, 78% for the last known average for 2001-2005).

The 2007 results continued this trend, with the percentage of total grape production earmarked for purposes other than pressing nearing 37.5% (36.6% in 2006) and the percentage of production intended for table consumption nearing 80% (79% in 2006).

Of the whole, considering that 135 kg of fresh grapes are needed to obtain 1hl of wine, the percentage of world grape production which was pressed but not fermented (i.e. musts and concentrated or non-concentrated juice) for the campaign under consideration may be determined by subtraction (NB in the past the world average was established at 138 kg/hl, however advances in dreg filtering in some countries have apparently brought this production ratio down).

As indicated in the comments from previous years:

- there is an upward trend in the percentage of world grape production used to make non-fermented products, despite a recent setback due to the need to replenish wine stocks after the poor productions of 2002 and 2003 (4.2% on average 1986-1990, 6.8% on average 1991-1995, 8.7% on average 1996-2000 and 7.9% on average 2001-2005);
- the 2006/2007 campaign was unusual in that it was consistent with the long-term trends for the percentage of non-pressed products, but was atypical in terms of the share of non-wine products categorised under the pressed grape products. This was probably in connection with fairly strong growth in world demand for wines between 2005 and 2006 (which was +5.6 Mhl), this rate had only been 6.1%.

However, it may be noted that, on this point as well, the 2007 campaign was almost in line with the trend. Although it may not have grown, it at least reached a fairly high percentage of non-wine products amongst pressed grape products: 8.3%.

It should also be remembered that, as with each year, although some products are not all intended for sale as is (i.e. some are "buffer" stocks, for example, used to enrich future harvests), the size of this market, as well as any potential changes to its regulatory framework (especially in customs matters, to eventually define the non-preferential origin of products with the WTO) reinforce the need to collectively improve monitoring.

6.2. Wines

Lower production, apparently modest drops in carryover stocks from the 2006/2007 campaign, and a fairly marked increase in consumption led to a world balance that was much tighter in 2007 than in 2006.

Thus the gap between wine production and consumption in 2007 was almost 16.8 Mhl, a sharp drop from the 39.1 Mhl reported in 2006 and 38.3 Mhl of the last known five-year average (2001-2005). This discrepancy is lower than the traditionally assessed needs for traditional retail industrial purposes (i.e. production of brandies, vinegars and vermouths).

Table 7: Gap between world wine production and consumption (in hl)

Periods/years	Production	Consumption	Difference
1976-1980	326 046 000	285 746 000	40 300 000
1981-1985	333 552 000	280 718 000	52 834 000
1986-1990	304 192 000	239 473 000	64 719 000
1991-1995	263 092 000	223 155 000	39 937 000
1996-2000	272 557 000	224 629 000	47 928 000
2001-2005	272 780 000	234 457 000	38 323 000
2002	257 123 000	229 998 000	27 125 000
2003	264 266 000	237 386 000	26 880 000
2004	296 734 000	239 040 000	57 694 000
2005	280 106 000	238 387 000	41 719 000
2006	283 149 000	244 000 000	39 149 000
2007	265 994 000	249 190 000	16 804 000

WORLD VITIVINICULTURAL STATISTICS 2007

On the level of the most prolific wine-producing countries, it is interesting to observe the evolution of the difference between total wine production and domestic wine consumption.

As with last year, these countries may be classified into 3 groups, stripping out Germany, where domestic consumption is twice as large as its production and which is therefore a net importer (and which has for several been the world's largest importer by volume):

- Countries with similar levels of production and consumption yet which remain net importers. This includes the USA and China (discrepancy between production and consumption carried over to production levels: in 2007 -42% and -13% respectively). In these two countries, import levels have increased more rapidly in recent years, as have exports. These first two countries, however, are still distinguished by their openness to the world market. While the USA, which kept its position this year as third-largest importer and 6th-largest exporter, is quite open to the market, China is not. This tends to confirm its tendency to supply its domestic needs (*with the exception of the reserves indicated above, and taking into account the fact that the quantity of domestically-produced wine in a given wine believed to be Chinese cannot be precisely known, given the difficulties in tracking wines imported to China, via Hong Kong especially*).

As forecast in 2005, Argentina is no longer one of these countries. Its favourable exchange rate has led it to increase its wine imports in recent years. Moreover (a factor not taken into account in table 8) it continues to export a non-negligible portion of its production in the form of musts and juices.

- Net exporting countries, whose domestic markets are receding but which remain major outlets. France and Italy, and more recently Argentina, are in this group. It should nevertheless be noted that the downward trend in domestic consumption condemns these traditional wine-producing countries to either reduce their production potential or turn increasingly towards exports.
- Countries with a clear focus on exporting (at least a 60% discrepancy between production and domestic consumption). South Africa and Spain, which were on the fringes of this group until the end of the 1990s, clearly joined it from 2003 onwards, despite the fact that in these two countries (especially Spain), a non-negligible part of the discrepancy between production and consumption is locally transformed into alcohol, and that a non-negligible portion of this alcohol is subsequently consumed. Australia and Chile corresponded to the typical profile of this group in 2007, as in previous years.

The year 2007 (and overall the first part of the 2007/2008 campaign) was therefore characterised by similar overall grape production to the two previous campaigns but in which the increase in non-wine production (e.g. table grapes, raisin grapes and non-wine pressed products) led to a slight decrease in overall wine production compared to 2006 production (-17.2 Mhl). This is all the more true given that major wine-producing countries (France and Australia especially) saw major drops in their wine production (6.4 Mhl and -4.7 Mhl respectively) due to weather conditions which aggravated these other underlying trends.

In the face of demand which has clearly increased for the second consecutive year (inter-annual increase in world consumption above 5 Mhl), the wine market enjoyed an overall performance that was more favourable than the three previous campaigns (2004/2005 to 2006/2007), characterised by the slow depletion of the world surplus that followed the 2004 bumper crop.

This improvement was also caused by continued trends detected the previous year:

- A slowed pace of new plantings (globally the vine pull to planting ratio led to a fairly slow but continuous decrease of the world area under vines since 2003) and therefore to fewer new vineyards starting to produce than at the turn of the millennium,
- The continued expansion of the geographic area of world wine consumption (the six main wine-producing and -consuming countries – France, Italy Spain, USA, Argentina and Germany – which accounted for 60% of world consumption on average from 1996-2000, and 56% on average from 2001-2005, now only accounts for 53% of wine consumption in 2007),
- Increasing environmental awareness (especially relating to water management) is leading winegrowers to use yield-increasing measures in their quest for competitiveness only if they are sustainable.

These elements enable the conclusion that a dynamic near-balance may happen in the long run, at a quantitative level that progressively exceeds today's, yet apparently without the possibility of avoiding major short-term upsets against a general backdrop of lesser remedial possibilities, limited to regulatory tools of the agricultural markets (cf. influence of the WTO agreements on agricultural matters).

Finally, to the contrary, as with last year, this foreseeable progressive balancing in the long term may be upset or suffer considerable changes depending on the production zones and types of wine, because of:

- differences in anti-drinking measures taken by the public health authorities,
- possible opening of wine practices (especially if this opening happens at different paces in different countries) which could encourage renewed competitiveness linked to production costs and access to technology,
- some agricultural and/or social policies encouraging partial disinvestment in certain areas of production.

More generally, in conclusion it seems useful to bear in mind that the influence and nature of intervention methods used in the vitivinicultural industry vary by type of wine and country/set of countries. It is therefore highly complex to identify the influence of changes in intervention in the broad sense of the word (i.e. standards, production rights, quota regulations, taxation, free or restricted access to certain natural resources, revenue subsidies etc.) in a world market where all types of wines are potentially interdependent and where the hierarchies existing between these wines differ from one country to another.
